

Ibutamoren MK-677 25 mg 100 tabs Rus Bio

Description

Rus Bio SARM Ibutamoren (MK-677)

MK-677 from **Rus Bio SARM**, also known as **Ibutamoren**, is a growth hormone due to its structure. MK-677 does not belong to the SARM family.

The reason ibutamoren is so special is that it can stimulate growth hormone (GH) and insulin-like growth factor (IGF-1). This leads to increased muscle growth and fat loss, as well as an improvement in well-being.

Advantages of IBUTAMOREN MK-677 Rus Bio SARM

- activates the secretion of growth hormones
- promotes the production of testosterone and GH (growth hormone)
- Increases muscle growth
- Accelerates fat burning
- Increases IGF-1
- Has a positive effect on skin, hair and nails
- promotes protein synthesis
- Promotes insulin sensitivity
- suppresses the stress hormone cortisol
- Improves deep and restful sleep
- improves the immune system
- improves regeneration overnight
- blocks the myostatin

In summary, MK677 helps you build quality muscle mass and improve your recovery . In addition, the supplement gives you more strength and endurance. The main reason why MK-677 is used in bodybuilding is for the sole purpose of increasing GH levels . Since human growth hormone (HGH) is very expensive, there are no other alternatives to increase growth hormone than Ibutamore. Ibutamore (Nutrabol) is much cheaper compared to actual HGH and can significantly increase growth hormone levels, exactly what bodybuilders want. Other androgenic effects such as hair loss, high blood pressure or gynaecomastia are no longer a problem with this product!

IBUTAMOREN MK-677 Rus Bio SARM recommended use:

Recommended use

Take 1 tablet of MK-677 25 mg per day.

Bodybuilders and athletes like to use Ibutamoren MK-677 in combination with insulin, anabolic steroids or SARMS during muscle building, as the intake of RUS BIO SARM MK-677 leads to an increased secretion of the hormone ghrelin, which is responsible for stimulating appetite.

Women take MK-677 in doses between 5 mg and 25 mg per day and thus achieve a firm muscle. Another advantage of MK-677 is that there is no risk of virilisation (masculinisation).

Ibutamoren is used to build muscle for at least 12 weeks, and many users are happy to extend the cycle to 14 weeks or longer. This makes sense because growth hormone and IGF-1 require a longer start-up time, so a short duration of use is usually not enough to build consistent muscle mass.

Before taking this product, consult your doctor. Do not exceed the recommended daily dose. This product should only be consumed by healthy adults over the age of 18. Food supplements should not be used as a substitute for a balanced and varied diet.

Keep out of the reach of children. After opening, store in a cool, dry place.

Side effects of IBUTAMOREN MK-677 Rus Bio SARM

The most common side effects of MK-677 were found to be numbness in the hands, muscle and joint pain and increased appetite after use.
