

# Sustanon 250 mg Rus Bio

## Description

**Manufacturer:** Rus Bio Pharma  
**Pack:** 10 ml / (250 mg/ml)  
**Substance:** Testosterone Blend

# What is Sustanon? | Rus Bio Sustanon

**Rus Bio Sustanon** is the brand name of **Sustanon** or also known as **Sustanon 250** and we are quite sure that many of you have heard about **Sustanon** as this is a very famous steroid all over the world for its physique and performance enhancing properties.

Very often, this product is being used by bodybuilders and those people who are searching for **Hormone Replacement Therapy (HRT)** but is also having many other uses such as muscle building properties, losing weight.

Why would a product be so helpful? Because **Sustanon** is basically offering **testosterone**. It contains 4 different testosterone esters: 30 mg of **Testosterone Propionate**, 100 mg of **Testosterone Decanoate**, 60 mg of **Testosterone Phenylpropionate** as well as 60 mg of **Testosterone Isocaproate**.

Now, you may be wondering why would a product need 4 different testosterone esters when ultimately you receive the same active substance – **testosterone**. Each ester is coming with different half lives and this means they enter your blood system at different times and they leave your system at different times. This ensures you get stable blood levels and peak blood level is always high.

**Isocaproate** is having an approximate half life of 9 days, **Phenylpropionate** has a half life of 5.5 days, **Propionate's** half life is anywhere between 1 to 3 days and **Decanoate** is offering the longest half life of approximately 11-12 days.

With this being said, you inject the product and testosterone is lingering into your bloodstream at different times, maintaining peak blood levels and stable blood levels with **Propionate** being the first to enter and **Decanoate** the last to flush out of your system.

The product was originally made by **Organon** as **Sustanon 250** but this product is called **Rus Bio Sustanon Sustanon** and manufactured by **Rus Bio** which is offering the product for a much attractive and lower price.

This is an anabolic and androgenic steroid coming as an oil based solution which is administered by intramuscular injection. Except for physique and performance enhancement purposes, this steroid is also having some medical uses, mainly as a **HRT** product.

## What is Rus Bio Sustanon Used For?

As it was just mentioned, **Sustanon** is actually used in medical settings as a **Hormone Replacement Therapy** in most cases. It is given to those men who are suffering from low testosterone levels because low testosterone condition can be very bothersome with various bad side effects.

But this form of testosterone is very famous and very widely used as an anabolic steroid among bodybuilders, powerlifters and athletes for improving their physique and enhancing their performance. It is most often used also as HRT during the administration with other steroids which might inhibit natural testosterone production, it can be used for cutting cycles (but very rarely) and is very often used for bulking cycles when the individual needs to gain as much muscles and size as possible.

This product is basically offering **testosterone**. Synthetic **testosterone** received from this product is working no differently from the natural occurring **testosterone**. So, using this product is actually no different from using any other esterified form of testosterone as they are all elevating your testosterone levels.

The difference, as mentioned, is that you keep stable blood levels at their peak. Other than that, you just receive testosterone and as is known, testosterone is the main and is the essential hormone for building muscle mass, enhancing performance and others.

With more levels of **testosterone**, people are increasing their strength, increasing their libido, they have a much faster and better protein synthesis, much improved recovery after each training and a number of other benefits thanks to higher levels of testosterone.

## How to Take Rus Bio Sustanon | Sustanon Cycles

**Sustanon** is an injectable **AAS** and that's why it should be injected intramuscularly. Injection frequency varies. While some people are injecting this product every 3 days, that's considered not necessary. Other people are injecting it once every week. When prescribed for medical issues, it might be given even less frequently. Nonetheless, most people seem to find their sweet spot at every 5 days use. This seems to be the best injection schedule.

Dosing ranges are varying very much. It depends on a lot of different factors such as personal tolerance, personal knowledge/ experience, personal goals, what other steroids are used alongside with this steroid and other factors. With this being said, dosing ranges between 250 mg up to 1500 mg a week. Nonetheless, most people seem to find their sweet spot at 500 to 750 mg a week.

With this being said, the most often injection schedule of Sustanon is 500 mg every 5 days. Here is an example of a really good cycle with [Sustanon](#). Most cases, as mentioned, they are for bulking and that's why used alongside with wet/ bulking steroids.

Start with 6 weeks of **Dianabol** 40 mg a day and stop it at the 6th week. From day 1 to last day go with 12 weeks of 500 mg a week of **Sustanon**, 600 mg a week of **Deca**, 25 mg each of **Ostarine** and **Aromasin** (for dealing with side effects) as well as **N2Guard** to be added. Add a **PCT** plan too at the end.

## Sustanon 250 Rus Bio Side Effects

The side effects of **Sustanon** are considered the same side effects of using any other given form of **testosterone** or simply abnormally having high levels of testosterone in the body. That's because, as mentioned, you're basically getting synthetic testosterone that is no different from naturally occurring one. There's nothing else other than that.

So, side effects include estrogenic side effects because testosterone is converting to estrogen because of the aromatase enzyme. Gynecomastia, water retention and other estrogen related side effects are possible to occur.

**Testosterone** also might convert into **dihydrotestosterone (DHT)** by the 5 reductase enzyme and this includes androgenic side effects such as oily skin, acne, hair loss, aggression and others.

Women are very warned against **virilizing** side effects which are very possible to occur. Natural **testosterone** production would get inhibited as well so a PCT cycle is important.

Other than that, too high levels of **testosterone** can be associated with negative effects upon cholesterol and cardiovascular health so make sure to keep cardiovascular and cholesterol in care by using supplements.
