

# **Boldenone Undecylenate 250 mg Rus Bio / 10 ml**

## **Description**

**Manufacturer: Rus Bio Pharma  
Pack: 10 ml / (250 mg/ml)**

## Substance: Boldenone Undecylenate

**Boldenone undecylenate** (very often being known by its brand name – **Equipoise**) is an injectable steroid that is having some really strong anabolic and some moderate androgenic abilities and properties. The compound is considered to have very well balanced anabolic and androgenic properties and this is one of the main reasons why it is being so popular in the fitness community and so appreciated by bodybuilders and other athletes.

Below you're going to find all the products containing **Boldenone Undecylenate**. Also you would find other valuable information about this product.

## What is Boldenone Undecylenate? | What is Equipoise? |

**Boldenone Undecylenate Rus Bio** that is also known as **Boldenone Undecylenate** or simply **EQ** but might be better known by many people as its other and more famous brand name – **Equipoise**, is a steroid that is officially used in veterinary settings and it was manufactured many years ago in 1960s by **CIBA**.

**Boldenone Undecylenate Rus Bio** is manufactured by **Rus Bio** – a famous pharma company which is oriented in selling high quality **performance enhancing drugs (PEDs)**. The active substance here is **Boldenone Undecylenate** but the product might be better known as **Equipoise**. This is a form of long acting injectable famous anabolic and androgenic steroid – **Dianabol (Methandrostenolone or Methandienone)**.

**Equipoise** has been intended to be used in the horse as well as cattle industry – generally in veterinary setting. This is an oil based solution that is intended to be used once a week due to its very long half life or once every 6 weeks in animals. Bodybuilders and athletes have experimented with this compound (pretty much as with any given steroid) and despite the fact that it was meant to be a steroid used in veterinary settings only, **Boldenone** has been found to be a very powerful steroid with humans.

**Undecylenate** in **Boldenone Undecylenate** is only the attached ester which is delaying the release of the main hormone – **boldenone** in the system after it got used. This is a very long based ester which is delaying the half life to about 14 days or even more.

The fact that it is coming in an oil based solution with the attached ester delaying the half life to a lot of time is pretty much the only difference from **Dianabol** which has the C17 AA group and shorter half life.

# How Does Boldenone Undecylenate Work? | Equipoise Uses | What Boldenone Undecylenate Rus Bio Does?

**Boldenone Undecylenate Rus Bio** is a steroid which is used with great success by bodybuilders, powerlifters as well as athletes for physique and performance enhancement purposes – more specifically for increasing endurance, muscle mass and this is a product especially notorious for producing a lot of amounts of red blood cells in the body.

In the past, this product was used for medical uses too but it then got discontinued. Nowadays, this compound is used only in veterinary medicine, mainly in horses and also as a physique and performance enhancing steroid.

**Boldenone Undecylenate Rus Bio**, as any given AAS out there, is an agonist of the androgen receptor and is having some strong anabolic effects combine with pretty moderate androgenic effects and also with low estrogenic activity with no progestogenic activity at all. By binding to the androgen receptor, the product is showing off its potency.

Its structural changes made this product very famous for offering slow and yet steady and good gains when the individual is going through the bulking cycles when more muscle mass and size is required and the individual needs to get as big as possible in mass and muscles.

This steroid is used with great success for bulking cycles (despite the fact that it can be and is sometimes used for cutting cycles too) because it can offer lean and quality muscle mass in the time that the individual is getting strength gains. This all sounds great and is even better when combined with less side effects than **Deca Durabolin**, therefore not being so bad in terms of side effects.

**Boldenone**, by increasing red blood cells, this is leading to more hemoglobin and a higher oxygen carrying capacity. This means that the muscles get more oxygen and more nutrients, therefore growing more efficiently and faster.

## How to Use Boldenone Undecylenate Rus Bio? | Boldenone Cycle | Doses of Equipoise

As it was mentioned – **Boldenone Undecylenate** which is found in **Boldenone Undecylenate Rus Bio** (or **Equipoise – EQ**) is coming in an oil based solution and it should be used intramuscularly. Also, it offers a very long half life and this means that using it once a week would provide stable blood levels.

Just inject the total weekly dosage in a day of the week and repeat this for the entire steroid cycle. Usually, long acting steroids are requiring long cycle lengths. The same goes for [Boldenone Undecylenate](#) which is most often cycled for about 12-14 weeks.

As mentioned, it can be used with great success for both bulking and cutting, although bulking is the most favorite cycle type with **Boldenone** for most people. Also, this is a very universal steroid which can be stacked with most other steroids out there.

**EQ** dosages (**Boldenone Undecylenate Rus Bio**) are usually ranging anywhere between 200 mg up to 600 mg a week, for a total of about 12 weeks. Women should either not use this compound at all, or use it in doses very low as 25-50 mg per week and with short cycle lengths.

For cutting is being stacked with either **Trenbolone (Tren)** or **Winstrol (Stanozolol)**. For bulking with **testosterone** (usually long esters such as **Cypionate**) and **Dianabol**. Do not forget about **aromatase inhibitors**, **PCT** plan and supplements like **cardarine** and **N2Guard**.

## **Boldenone Undecylenate Rus Bio Side Effects | Side Effects of Equipoise**

If you are not going to add **aromatase inhibitors** like **Arimidex** you risk getting estrogenic side effects such as water retention, bloating, gynecomastia and other related to estrogen.

By not having a good **PCT** plan, you risk getting into a low **testosterone** condition due to natural inhibition of testosterone with **Boldenone Undecylenate Rus Bio** .

Women risk getting virilizing side effects which is why they should avoid this steroid or use it in very low doses if that's absolutely necessary. Men risk going through negative DHT – androgenic side effects which are usually manifesting in hair loss, excessive hair growth on body and face, aggression, acne, oily skin and others.

Supplements are required for keeping your cardiovascular health and cholesterol levels in normal range due to the possible negative effects of **Boldenone** on them.

**Boldenone Undecylenate Rus Bio** or **Equipoise**, is notorious for 2 side effects – this compound is going to boost your appetite and that’s a problem for those who want to go through cutting cycles and is causing acne on the chest, back and shoulders. Anti acne solutions (like soaps, tablets, anti bacterial stuffs) are very recommended.
